

Jonathan Lee Personal Website

Website Creative Brief + Sitemap v1.0

Document Version: 1.0

Project Type: Personal professional website / Data engineering portfolio

Primary Owner: Jonathan Lee

Primary Market: United States

Primary Language: English

Location Positioning: New York-based

Primary Use Case: Data Engineer / Analytics Engineer job search

Secondary Use Case: Long-term professional brand, technical writing, product-building credibility and selected Solvia One work

Working Design Direction: Editorial Data Systems

1. Executive Summary

The Jonathan Lee personal website will be a professional engineering portfolio designed to present Jonathan as a data engineer, analytics systems builder and independent problem solver.

The website must not resemble a generic developer portfolio, online résumé template or technology-logo gallery. It should function as a curated engineering record that demonstrates how Jonathan identifies problems, designs systems, makes technical decisions and delivers complete data products.

The site will combine four qualities:

1. Engineering credibility

Demonstrate complete data workflows, architecture decisions, modeling practices, data quality controls and operational thinking.

2. Product-building ability

Show that Jonathan can move beyond isolated scripts and dashboards to build usable internal tools and end-to-end systems.

3. Clear professional positioning

Make it immediately clear that Jonathan is targeting Data Engineer and Analytics Engineer roles rather than general software engineering or product management roles.

4. A distinctive personal brand

Use editorial composition, engineering diagrams, real project evidence and disciplined writing instead of common portfolio clichés.

The central brand principle is:

Evidence first, personality through presentation.

Visitors should infer Jonathan's reliability, curiosity, judgment and initiative from the work itself rather than from unsupported self-descriptions.

2. Project Background

Jonathan's current professional assets already include:

- A completed HTML résumé and PDF résumé
- Five substantial data engineering and analytics projects
- A production-oriented SEC financial data platform currently under development
- Experience with Python, SQL, Snowflake, dbt, Airflow, Prefect, Spark, Kafka, AWS, Power BI and data quality tooling
- A locally built Job Search OS with URL ingestion, browser extension support, evidence-based scoring, SQLite persistence and application tracking
- Real operational and business systems developed through Solvia One
- Ongoing Snowflake platform study and SnowPro Core preparation
- Experience translating business requirements into reports, workflows, tools and data models

The website will organize these assets into a coherent professional narrative rather than presenting them as unrelated repositories or résumé entries.

3. Strategic Positioning

3.1 Primary Professional Identity

Jonathan Lee

Data Engineer & Analytics Systems Builder

This title is intentionally broader than "Data Engineer" while remaining clearly within the data profession.

It covers:

- Data engineering
- Analytics engineering
- Data modeling
- BI and reporting systems
- Internal tools
- Workflow automation

- Data quality and observability
- Business-facing data products

It does not position Jonathan as a general software engineer, product manager or AI researcher.

3.2 Core Positioning Statement

Jonathan Lee builds reliable data systems that transform fragmented information into usable decisions.

3.3 Supporting Positioning Statement

His work combines data engineering, analytics architecture and practical automation using Python, SQL, Snowflake, dbt and modern orchestration tools.

3.4 Differentiation

The site should distinguish Jonathan through the following characteristics:

Common portfolio pattern	Jonathan's website approach
Technology logo collection	Architecture, decisions and evidence
Course-project gallery	Production-style case studies
Generic personal introduction	Clear engineering point of view
Screenshots without context	Problem-to-system narrative
Skill percentage bars	Demonstrated implementation
Decorative animation	Purposeful system visualization
Every project treated equally	Curated hierarchy
Résumé duplicated as a website	Independent professional narrative
"Passionate developer" language	Concrete engineering outcomes

4. Website Objectives

4.1 Primary Objective

Increase the probability that a qualified visitor proceeds from initial review to one of the following actions:

- Reviews a detailed project case study
- Opens Jonathan's résumé

- Visits a relevant GitHub repository
- Contacts Jonathan
- Invites Jonathan to an interview

4.2 Secondary Objectives

The website should also:

- Establish Jonathan as a credible Data Engineer / Analytics Engineer candidate
- Demonstrate technical communication skills
- Show engineering depth beyond dashboard creation
- Provide context that cannot fit into a résumé
- Support LinkedIn networking and recruiter outreach
- Serve as a central destination for future writing and tools
- Build a professional identity that remains useful beyond the current job search
- Connect Jonathan's engineering work with Solvia One without confusing the site with a company website

4.3 Non-Objectives

Version 1.0 is not intended to:

- Operate as a full commercial agency website
- Sell consulting packages
- Function as a personal lifestyle blog
- Contain every project Jonathan has completed
- Provide a public login or application backend
- Host the complete Job Search OS for public use
- Replace LinkedIn or GitHub
- Maximize page count
- Demonstrate frontend animation skills

5. Target Audiences

5.1 Primary Audience: Hiring Managers

Typical roles:

- Data Engineering Manager
- Analytics Engineering Manager
- Director of Data
- Head of Analytics
- BI Engineering Manager
- Data Platform Lead

Their main questions are:

- What kind of data professional is Jonathan?
- Can he build a complete system?
- Does he understand data modeling and quality?
- Can he explain technical decisions?
- Does he think beyond individual scripts?
- Is his experience relevant to our team?
- Is he worth interviewing?

The site must answer these questions within one to three minutes.

5.2 Secondary Audience: Technical Interviewers

Typical roles:

- Senior Data Engineer
- Staff Data Engineer
- Analytics Engineer
- Data Architect
- Platform Engineer

Their main interests are:

- Architecture
- Data flow
- Model design
- Error handling
- Orchestration
- Testing
- Scalability
- Cost
- Trade-offs
- Repository quality

5.3 Third Audience: Recruiters

Recruiters need a faster path.

They should be able to identify within approximately 30 seconds:

- Jonathan's role
- Location
- Core stack
- Current focus
- Selected work
- Résumé link

- Contact path

5.4 Fourth Audience: Potential Collaborators and Clients

These visitors are relevant but must not control the primary messaging.

They should understand that Jonathan can:

- Translate operational problems into systems
- Build lightweight internal tools
- Structure and model business data
- Automate repeatable workflows
- Communicate technical work clearly

5.5 Fifth Audience: Professional Community

This includes peers, networking contacts and readers interested in:

- Data engineering
- Snowflake
- dbt
- Data quality
- Pipeline design
- Engineering career development
- Building practical internal tools

6. Brand Foundation

6.1 Brand Attributes

The brand should feel:

- Precise
- Reliable
- Thoughtful
- Technical
- Structured
- Modern
- Independent
- Practical
- Calm
- Human

6.2 Brand Attributes to Avoid

The site should not feel:

- Flashy
- Cyberpunk
- Corporate-generic
- Overly luxurious
- Gamer-oriented
- Crypto-oriented
- Aggressively futuristic
- Tutorial-like
- Junior-template-driven
- Artificially authoritative
- Filled with startup marketing language

6.3 Brand Promise

Visitors will leave with a clear understanding of what Jonathan builds, how he thinks and why his work is relevant.

6.4 Brand Archetype

The primary archetype is:

The Engineer-Editor

The Engineer creates reliable systems.

The Editor selects, structures and explains information with discipline.

This combination should guide both content and visual presentation.

7. Core Narrative

The website should communicate the following sequence:

1. Jonathan builds data systems.
2. His systems solve identifiable information and decision-making problems.
3. He understands the full lifecycle from source ingestion to usable output.
4. He values reliability, quality and clarity.
5. He can independently build tools, not only complete assigned tasks.
6. He applies engineering in both portfolio and real operational contexts.
7. He is currently seeking Data Engineer and Analytics Engineer opportunities.

The site should not lead with career history.

It should lead with current capability and evidence.

8. Messaging Framework

8.1 Primary Headline

I build reliable data systems that turn fragmented information into usable decisions.

8.2 Primary Descriptor

Data Engineer & Analytics Systems Builder

8.3 Supporting Description

Data engineering, analytics architecture and practical automation using Python, SQL, Snowflake, dbt and modern orchestration tools.

8.4 Location Line

Based in New York.

8.5 Availability Line

Recommended wording:

Exploring Data Engineer and Analytics Engineer opportunities.

This language should appear in the About or Contact area rather than dominating the hero.

8.6 Short Professional Bio

Jonathan Lee is a New York-based data professional focused on building reliable data platforms, analytics systems and practical workflow tools. His work connects data engineering with business context through end-to-end pipelines, dimensional models, data quality controls, orchestration and decision-ready reporting.

8.7 Solvia One Description

Jonathan is also a co-founder of Solvia One, where he applies data and software engineering to real operational and commercial problems.

Solvix One should be treated as supporting evidence, not the primary site identity.

9. Content Principles

All content should follow these rules.

9.1 Show the Work

Claims must be supported by:

- Diagrams
- Screenshots
- Code
- Data models
- Validation results
- Repository links
- Technical explanations
- Concrete project status

9.2 Explain Decisions

Projects must state:

- Why the system was built
- Why specific technologies were selected
- What alternatives were considered
- What trade-offs were accepted
- What limitations remain

9.3 Separate Work from Experiments

Production-style data projects belong under **Work**.

Tools, prototypes and product experiments belong under **Lab**.

9.4 Curate Aggressively

The homepage should show only the strongest and most relevant work.

Additional projects can remain accessible through the Work index.

9.5 Avoid Unsupported Metrics

The site should not invent:

- Performance improvements
- Revenue impact
- User counts
- Cost savings
- Scalability claims

When measurable results are unavailable, use implementation evidence and clearly described outputs.

9.6 Write for Fast Scanning

Each page should support both:

- A 30-second scan
- A five-minute deeper review

Headings, summaries, diagrams and callouts should carry the main narrative.

10. Information Architecture

10.1 Primary Navigation

The Version 1.0 navigation will be:

Home
Work
Lab
About
Resume
Contact

“Writing” will be introduced once at least two complete articles are available.

The preferred navigation order emphasizes evidence before biography.

10.2 Final Sitemap v1.0

/

└─ Home

```
|
|
|— Work
|   |— Work Index
|   |— SEC Financial Data Platform
|   |— CMS Healthcare Streaming Pipeline
|   |— Olist Commerce Analytics Platform
|   |— U.S. Flight Data Platform
|   └─ NYC Taxi Analytics Engineering
|
|— Lab
|   |— Lab Index
|   |— Job Search OS
|   |— Profit Distribution Calculator

/about
/resume
/contact
```

Future structure:

```
/writing  
/writing/article-slug  
/zh
```

11. Page Definitions

11.1 Home

Purpose

Establish Jonathan's identity, demonstrate his strongest work and guide visitors toward case studies, résumé or contact.

Primary Visitor Question

Who is Jonathan, what does he build and where should I click next?

Homepage Content Order

Section 1: Hero

Required content:

- Name
- Professional title
- Core positioning statement
- Supporting stack statement
- New York location
- Two primary calls to action

Recommended buttons:

- **View Selected Work**
- **Read My Resume**

Optional tertiary link:

- GitHub

The hero should include a restrained visual representation of a data system:

Sources → Ingestion → Warehouse → Models → Quality → Decisions

This visual should communicate professional identity rather than function as decoration.

Section 2: Current Focus

Purpose:

Show that Jonathan is actively building and learning.

Initial entries:

1. SEC Financial Data Platform
2. Job Search OS
3. Snowflake Engineering Practice

Each item should include:

- Number
- Title
- One-sentence description
- Status label

Example statuses:

- In Development
- Active Build
- Current Study

Section 3: Selected Work

Feature three projects:

1. SEC Financial Data Platform
2. CMS Healthcare Streaming Pipeline
3. Olist Commerce Analytics Platform

Each project preview should include:

- Project number
- Title
- One-sentence problem statement
- Short technical summary
- Technology line
- Architecture image or representative screenshot
- Case study link

Section 4: Engineering Principles

Initial principles:

Reliability before novelty

Pipelines should be observable, testable and recoverable.

Model for the consumer

Data architecture begins with the decisions users need to make.

Quality is part of the pipeline

Validation is not a final cleanup step.

Build complete systems

Ingestion, transformation, orchestration, documentation and delivery should operate as one coherent product.

Section 5: Lab Feature

Feature:

Job Search OS

The section should explain that the tool:

- Imports job descriptions
- Supports browser-based ingestion
- Evaluates fit using profile evidence
- Detects duplicate roles
- Stores job records locally
- Tracks application status
- Supports human review rather than fully automated submission

It should include a strong product screenshot and a link to the full Lab case study.

Section 6: About Preview

A short professional summary of approximately 80–120 words.

Include:

- New York
- Data engineering focus
- Analytics systems
- Practical tools
- Solvia One
- Link to full About page

Section 7: Contact Callout

Recommended message:

Have a data engineering role, technical problem or project worth discussing?

Actions:

- Email
 - LinkedIn
 - GitHub
 - Resume
-

11.2 Work Index

Purpose

Present Jonathan's strongest Data Engineering and Analytics Engineering projects as a curated portfolio.

Page Structure

1. Page introduction
2. Featured projects
3. Additional projects
4. Engineering capability summary
5. Resume call to action

Project Order

Recommended initial order:

1. SEC Financial Data Platform
2. CMS Healthcare Streaming Pipeline
3. Olist Commerce Analytics Platform
4. U.S. Flight Data Platform
5. NYC Taxi Analytics Engineering

Project order should be based on relevance and engineering depth, not chronological order.

Project Card Information

Each project card should show:

- Title

- Category
- Year
- Status
- Short problem statement
- Core stack
- Primary engineering capability
- Case study link

Recommended capability labels:

- Batch Data Platform
 - Streaming Architecture
 - Analytics Engineering
 - Semi-Structured Data
 - BI and Dimensional Modeling
-

11.3 Work Case Study Template

Every Work case study should use a common content model.

Case Study Structure

1. Project Header

Include:

- Project title
- Category
- Status
- Year
- Short summary
- Core technology stack
- GitHub link
- Demo or dashboard link when available

2. Executive Overview

A short explanation of:

- What was built
- Why it matters
- What the final system produces

3. Problem

Define the user, business or analytical problem.

Avoid beginning with the technology stack.

4. Constraints

Examples:

- Public API rate limits
- Inconsistent schemas
- Missing values
- Limited cloud budget
- Local development environment
- Large file volumes
- Mixed reporting periods
- Domain-specific definitions
- Limited access to production infrastructure

5. Architecture

Include:

- Architecture diagram
- Component descriptions
- Data movement
- Storage layers
- Processing layers
- Consumption layer

6. Data Flow

Show the lifecycle from source to output.

Example:

```
SEC API
→ Raw JSON
→ S3
→ Python / Spark staging
→ Snowflake raw schema
→ dbt staging
→ dbt core
→ dbt marts
```

- Data quality checks
- Financial monitoring and dashboards

7. Data Modeling

Explain:

- Grain
- Keys
- Dimensions
- Facts
- Layering
- Naming conventions
- Incremental strategy
- Business logic

8. Data Quality and Validation

Include:

- Validation rules
- Failure handling
- Anomaly detection
- Missing data handling
- Duplicate handling
- Test results
- Great Expectations or dbt tests where applicable

9. Key Engineering Decisions

Each decision should use this format:

Decision

What was selected.

Reason

Why it was selected.

Alternative

What other approach was considered.

Trade-off

What limitation was accepted.

10. Challenges

Describe real technical difficulties.

Examples:

- SEC taxonomy variation
- Period classification
- Schema evolution
- Duplicate filings
- Source inconsistencies
- Batch size
- Memory constraints
- Idempotency
- Backfill strategy

11. Outputs

Include:

- Tables
- Dashboards
- Monitoring output
- Data quality reports
- Generated files
- Business metrics
- Screenshots

12. Lessons Learned

Focus on engineering understanding rather than generic self-reflection.

13. Next Improvements

State what a production expansion would include.

Examples:

- CI/CD
- Infrastructure as code
- Incremental ingestion
- Alerting
- Metadata catalog
- Improved lineage
- Automated backfills
- Cloud cost monitoring

14. Repository and Documentation

Include:

- GitHub

- README
 - Architecture diagram
 - Data dictionary
 - Dashboard
 - Relevant notebook or code directory
-

11.4 Lab Index

Purpose

Show Jonathan's ability to build practical tools, prototypes and workflow products outside conventional data pipeline projects.

Initial Lab Projects

1. Job Search OS
2. Profit Distribution Calculator
3. Selected internal or operational experiments

Lab Positioning

The Lab must not compete with the Work section.

Its role is to communicate:

Jonathan identifies recurring problems and builds usable systems to solve them.

11.5 Job Search OS Case Study

Purpose

Demonstrate product thinking, workflow design, data persistence and practical automation.

Recommended Structure

1. Problem
2. Users and workflow
3. Product requirements
4. System architecture
5. Job ingestion methods
6. Evidence-based scoring

7. Duplicate detection
8. SQLite persistence
9. Browser extension
10. Import Inbox
11. Tracker workflow
12. UI evolution
13. Fit-score consistency issue
14. Human-in-the-loop design
15. Privacy and local-first decisions
16. Current limitations
17. Planned development

Required Screenshots

- Job analyzer
- Fit score result
- Evidence section
- Tracker
- URL import
- Import Inbox
- Chrome extension
- Bilingual UI where relevant

Important Positioning

The case study should not imply that the tool automatically submits applications without review.

It should emphasize:

- Local-first storage
- Human review
- Evidence-based scoring
- Workflow consistency
- Reduced repetitive work
- Intentional avoidance of indiscriminate job applications

11.6 About

Purpose

Explain Jonathan's professional trajectory, current focus and approach to engineering.

Recommended Sections

Opening Summary

A concise present-tense professional introduction.

Professional Story

Explain the transition toward data work without apologizing for a non-linear career.

The story should emphasize:

- Business exposure
- Communication experience
- Data analysis
- System building
- Increasing technical depth
- Current focus on Data Engineering and Analytics Engineering

How I Work

Describe:

- Structured problem solving
- Business context
- Reliability
- Documentation
- Iterative building
- Clear communication

Current Focus

Include:

- SEC project
- Snowflake
- SnowPro Core
- Data engineering job search
- Job Search OS refinement

Solvvia One

Present Solvia One as evidence of applied problem solving.

Avoid making the section resemble a sales page.

Personal Context

A small amount of human context is appropriate:

- Based in New York
- Interested in data, technology, film, reading and travel

The page should remain professional rather than biographical.

11.7 Resume

Purpose

Provide a clear, recruiter-friendly résumé path.

Content

- Web résumé
- Download PDF
- LinkedIn
- GitHub
- Email

Requirements

- Preserve ATS-friendly content order
 - Use readable typography
 - Avoid decorative elements that interfere with scanning
 - Ensure PDF download works on desktop and mobile
 - Include a visible “Last Updated” date
 - Do not force users to submit a form
-

11.8 Contact

Purpose

Provide a direct, low-friction path to Jonathan.

Recommended Contact Options

- Email
- LinkedIn

- GitHub

Recommended Introductory Copy

I'm open to conversations about Data Engineer and Analytics Engineer roles, technical collaboration and practical data systems.

Contact Form Decision

No contact form in Version 1.0.

Reasons:

- Additional maintenance
 - Spam risk
 - Unnecessary backend
 - Email and LinkedIn are sufficient
 - Direct contact is more transparent
-

12. Visual Direction

12.1 Design Concept

Editorial Data Systems

The website should combine editorial publishing structure with technical system documentation.

The visual identity should feel like:

- A high-quality engineering journal
- A system architecture document
- A carefully designed technical publication
- A living project archive

It should not look like:

- A résumé template
 - A SaaS landing page
 - A dark hacker interface
 - A generic React developer portfolio
 - A collection of floating cards
-

13. Visual System

13.1 Color Palette

Primary Background

Warm Paper

#F3F0E9

Use for:

- Primary page backgrounds
- Large editorial sections
- About page
- Case study narrative sections

Primary Text

Carbon

#17191C

Use for:

- Main headings
- Body copy
- Navigation
- Strong borders

Secondary Text

Slate

#5B6168

Use for:

- Metadata
- Captions
- Secondary descriptions
- Dates
- Status details

Primary Accent

Data Teal

#146B68

Use for:

- Primary links
- Active navigation
- System nodes
- Selected labels
- Important diagrams
- Restrained emphasis

Secondary Accent

Signal Rust

#B45335

Use sparingly for:

- Warnings
- Anomaly callouts
- Selected highlights
- Important project decisions
- Data quality failures

Technical Panel Background

System Black

#111619

Use for:

- Architecture panels
- Code examples
- System diagrams
- Lab feature areas
- Technical screenshots

Technical Panel Text

Soft White

#ECEDE8

Border Color

Archive Line

#C9C5BC

13.2 Color Usage Rule

The site should remain primarily warm-light.

Dark technical panels should create rhythm and depth, not dominate every page.

Accent colors should occupy a small visual percentage of each page.

14. Typography

14.1 Display Typeface

Preferred options:

1. Instrument Serif
2. Newsreader
3. Source Serif 4

Use for:

- Hero headline
- Major page titles
- Selected editorial statements
- Large project titles

14.2 Body Typeface

Preferred options:

1. Inter
2. IBM Plex Sans
3. Manrope

Use for:

- Body copy
- Navigation
- Buttons
- Case study explanations
- Metadata

14.3 Monospace Typeface

Preferred options:

1. IBM Plex Mono
2. Geist Mono
3. JetBrains Mono

Use for:

- Technology labels
- Section numbers
- Status labels
- Figure captions
- Code
- Architecture annotations

14.4 Typography Principles

- Large headings should be confident but not oversized for spectacle.
 - Body text should remain highly readable.
 - Line length should generally remain between 60 and 80 characters.
 - Monospace should be used as a technical accent, not for full paragraphs.
 - Uppercase should be reserved for labels and metadata.
 - Typography must create hierarchy without excessive font weights.
-

15. Layout System

15.1 Grid

Use a 12-column desktop grid.

Recommended maximum content width:

1280px–1360px

Recommended narrative text width:

680px–760px

15.2 Spacing

Use generous vertical spacing between major sections.

Preferred spacing scale:

4
8
12
16
24
32
48
64
96
128

15.3 Structural Characteristics

The layout should use:

- Large section numbers
- Thin horizontal rules
- Asymmetric text and image placement
- Clear figure labels
- Wide margins
- Alternating editorial compositions
- Full-width technical panels
- Strong alignment
- Limited card grids

15.4 Border and Radius

Borders:

- Thin
- Precise
- Mostly neutral

Corner radius:

- Small to medium
- Avoid highly rounded SaaS cards
- Recommended range: 2px–10px

Buttons should not resemble pills unless used for compact status tags.

16. Component Language

The design system should include the following reusable components:

- Main navigation
- Mobile navigation
- Hero statement
- Primary button
- Secondary text link
- Section label
- Section number
- Project preview
- Project metadata row
- Technology label
- Status label
- Architecture figure
- Screenshot frame
- Code block
- Decision callout
- Trade-off callout
- Data quality callout
- Metric block
- Current focus row
- Engineering principle
- Resume download block
- Contact link group
- Footer
- Previous / next project navigation

Each visual component should support the overall editorial and technical identity.

17. Image and Diagram Direction

17.1 Primary Visual Evidence

Use:

- Architecture diagrams
- Data flow diagrams
- dbt lineage
- Table structures
- Pipeline screenshots
- Application screenshots
- Dashboard fragments

- CLI output
- Validation summaries
- Code excerpts
- Repository structures

17.2 Screenshot Treatment

Screenshots should not be pasted directly onto the page without context.

Each screenshot should use a standardized frame containing:

- Project name
- Figure number
- Figure title
- Optional environment label
- Short explanatory caption

Example:

```
SEC PLATFORM / DATA QUALITY / FIG. 04  
Quarterly duration classification validation
```

17.3 Architecture Diagram Style

Architecture diagrams should use:

- Simple geometric nodes
- Clear directional arrows
- Limited color
- Consistent labels
- No decorative cloud icon overload
- Grouping by system layer
- Visible boundaries between source, storage, processing and consumption

17.4 Personal Photography

A professional photograph is optional.

It should not dominate the homepage.

Preferred locations:

- About page
- Small footer or profile area

The website should derive identity primarily from work and visual system rather than photography.

18. Motion and Interaction

18.1 Approved Motion

Use only restrained motion:

- Initial fade and slight upward movement
- Project image scale on hover
- Link underline movement
- Navigation state transition
- One-time pipeline-node activation
- Subtle figure reveal
- Smooth but fast page transitions

18.2 Motion Timing

Recommended duration:

- Micro-interactions: 120–200ms
- Content reveal: 250–450ms
- Diagram sequence: under 1500ms

18.3 Motion to Avoid

Do not use:

- Cursor trails
- Code rain
- Background particles
- 3D globes
- Continuous marquee text
- Scroll hijacking
- Long cinematic transitions
- Excessive parallax
- Animated skill bars
- Auto-playing video
- Constantly moving diagrams

18.4 Reduced Motion

The site must respect the user's reduced-motion preference.

19. Voice and Tone

19.1 Voice

The writing should be:

- Direct
- Specific
- Evidence-based
- Calm
- Technically literate
- Honest about limitations
- Free of inflated marketing language

19.2 Preferred Language

Use statements such as:

- “Built an ingestion workflow for...”
- “Selected this approach because...”
- “The current implementation handles...”
- “A production version would require...”
- “The primary constraint was...”
- “This decision reduced...”
- “The trade-off is...”

19.3 Language to Avoid

Avoid:

- Passionate
- Guru
- Ninja
- Rockstar
- World-class
- Revolutionary
- Cutting-edge
- Best-in-class
- Expert in everything
- Scalable without evidence
- Production-ready without qualification
- Leveraged synergies
- Disruptive

19.4 First-Person Usage

Use first person where ownership and decisions matter.

Example:

I selected a layered dbt model because the raw SEC structure required separation between source normalization and business-level financial metrics.

Avoid repetitive sentences beginning with "I."

20. Responsive Design

20.1 Desktop

Desktop should preserve:

- Editorial asymmetry
- Large diagrams
- Multi-column project layouts
- Visible navigation
- Strong section numbering

20.2 Tablet

Tablet should:

- Reduce column complexity
- Preserve diagram readability
- Stack content where necessary
- Maintain generous spacing

20.3 Mobile

Mobile should prioritize:

- Clear identity
- Short summaries
- Tap-friendly navigation
- Legible diagrams
- Single-column project flow
- Fast access to résumé and contact

Large technical diagrams may use:

- Horizontal scrolling
- Simplified mobile versions
- Tap-to-expand behavior

The mobile version must not simply shrink the desktop layout.

21. Accessibility Requirements

Version 1.0 should meet the following standards:

- Semantic heading hierarchy
- Keyboard-accessible navigation
- Visible focus states
- Sufficient color contrast
- Alt text for meaningful images
- Captions for architecture diagrams
- No information communicated by color alone
- Reduced-motion support
- Minimum readable mobile font size
- Descriptive link labels
- Accessible PDF link
- Logical content order without CSS

Target standard:

WCAG 2.1 AA

22. Performance Requirements

The site should feel fast and technically disciplined.

Targets:

- Strong Core Web Vitals
- Optimized images
- Minimal JavaScript for static pages
- Lazy-load noncritical media
- Avoid large animation libraries
- Use local or optimized font delivery
- Avoid unnecessary analytics scripts
- Use static generation where appropriate

- Provide responsive image sizes

The site's implementation quality should reinforce Jonathan's engineering credibility.

23. Search and Metadata

Each page should include:

- Unique page title
- Meta description
- Open Graph title
- Open Graph image
- Canonical URL
- Structured project summary
- Descriptive URL slug

Example homepage title:

Jonathan Lee | Data Engineer & Analytics Systems Builder

Example meta description:

New York-based data engineer building reliable data platforms, analytics systems and practical automation with Python, SQL, Snowflake, dbt and Airflow.

24. Content Model

Projects should be stored using a reusable structure.

Recommended project schema:

```
title:
slug:
category:
year:
status:
featured:
summary:
problem:
users:
constraints:
architecture_image:
```

```
data_flow:
stack:
role:
responsibilities:
data_model:
quality_controls:
key_decisions:
tradeoffs:
challenges:
outputs:
lessons:
next_steps:
github_url:
demo_url:
dashboard_url:
images:
figures:
```

Lab projects may add:

```
product_stage:
workflow:
features:
storage:
privacy_model:
human_review:
known_limitations:
roadmap:
```

This structure should allow future projects to be added without redesigning the website.

25. Technical Direction

The final implementation decision will follow wireframing, but the preferred direction is:

- Next.js
- TypeScript
- Tailwind CSS or a small custom CSS design system
- MDX for project case studies
- Static generation
- Vercel deployment
- GitHub repository integration
- Lightweight analytics
- No database required for Version 1.0

- No CMS required for Version 1.0

Alternative deployment:

- GitHub Pages, provided routing and static generation remain straightforward

Vercel is preferred for simplicity if Next.js is selected.

26. Version 1.0 Scope

Included

- Home
- Work index
- SEC detailed case study
- CMS detailed case study
- Olist detailed case study
- Lab index
- Job Search OS detailed case study
- About
- Resume
- PDF download
- Contact
- Responsive design
- Basic SEO metadata
- Accessibility baseline
- GitHub and LinkedIn links

Work Index Only in Version 1.0

The following projects may initially appear as shorter entries without complete case studies:

- U.S. Flight Data Platform
- NYC Taxi Analytics Engineering

They can receive full case studies in Version 1.1.

27. Explicitly Out of Scope for Version 1.0

Do not include:

- Full blog platform
- Chinese-language website

- User accounts
 - Public Job Search OS deployment
 - Automated contact form
 - Newsletter
 - Testimonials
 - Client logos without formal permission
 - Skill bars
 - Dozens of technology logos
 - Certificate image gallery
 - Personal photo gallery
 - E-commerce
 - Consulting pricing
 - Full Solvia One corporate content
 - Complex 3D animation
 - Public project administration interface
 - Custom CMS
-

28. Success Criteria

The website will be considered successful when:

Identity

A visitor can identify Jonathan's role and focus within ten seconds.

Navigation

A visitor can reach a project case study, résumé or contact method within two clicks.

Credibility

The site demonstrates at least three complete data engineering stories with:

- Problem
- Architecture
- Decisions
- Quality
- Outputs
- Trade-offs

Distinction

The visual design does not resemble a generic developer template.

Readability

Recruiters can scan key information without reading every paragraph.

Technical Quality

The site performs well, works on mobile and contains no broken routes or downloads.

Conversion

The site supports recruiter outreach, interview preparation and LinkedIn networking by providing a credible destination beyond the résumé.

29. Version 1.0 Acceptance Checklist

Before launch, confirm:

- Hero statement is finalized
 - Professional title is consistent
 - Navigation contains no empty pages
 - All selected projects have accurate content
 - No fabricated results are included
 - Architecture diagrams use a unified style
 - Screenshots use standardized frames
 - GitHub links work
 - PDF résumé downloads correctly
 - Mobile layout is tested
 - Contact information is correct
 - Metadata is complete
 - Accessibility checks pass
 - Reduced motion is supported
 - Performance is acceptable
 - Solvia One does not overpower the personal brand
 - No unfinished placeholder sections remain visible
-

30. Locked Decisions

The following decisions are approved for Version 1.0:

1. The website is Jonathan Lee's personal professional website.
2. The primary audience is Data Engineer and Analytics Engineer hiring teams.
3. The primary identity is "Data Engineer & Analytics Systems Builder."

4. The design direction is “Editorial Data Systems.”
 5. The website will be English-first.
 6. Work and Lab will remain separate.
 7. The homepage will feature three primary data projects.
 8. Job Search OS will be the primary Lab feature.
 9. Solvia One will appear as supporting context, not the main brand.
 10. The interface will use a warm-light editorial foundation with dark technical panels.
 11. The site will avoid generic developer portfolio conventions.
 12. Version 1.0 will not include an empty Writing section.
 13. The contact path will use direct email, LinkedIn and GitHub links.
 14. Evidence and engineering decisions will take priority over skill claims.
 15. The site will be designed for both fast scanning and detailed review.
-

31. Decisions for the Wireframe Stage

The following details will be finalized while creating the homepage wireframe:

- Exact hero line breaks
- Exact pipeline hero visualization
- Desktop navigation behavior
- Mobile navigation pattern
- Placement of personal photograph
- Exact project preview compositions
- Light-to-dark section transitions
- Footer layout
- Resume page relationship to the existing HTML résumé
- Whether the Job Search OS preview uses one large screenshot or a multi-screen composition
- Whether the Current Focus section shows dates or status only

These are implementation-level decisions and do not alter the approved strategy.

32. Recommended Production Sequence

Phase 1: Content Inventory

Prepare:

- Project summaries
- Architecture diagrams
- Screenshots
- GitHub links
- Résumé assets
- Professional bio

- Contact information

Phase 2: Low-Fidelity Wireframes

Create:

- Homepage desktop
- Homepage mobile
- Work index
- Work case study
- Lab case study
- About
- Resume

Phase 3: Visual Design System

Finalize:

- Typography
- Color
- Grid
- Components
- Screenshot frames
- Diagram style
- Interaction states

Phase 4: High-Fidelity Prototype

Complete:

- Homepage
- SEC case study
- Job Search OS case study

These pages will establish the reusable visual system.

Phase 5: Development

Build:

- Shared layout
- Content model
- Responsive pages
- MDX case studies
- SEO
- Accessibility

- Deployment

Phase 6: Review and Launch

Validate:

- Content accuracy
 - Links
 - Mobile behavior
 - Performance
 - Recruiter usability
 - Visual consistency
-

33. Final Creative Direction

The final website should feel like the work of someone who:

- Understands systems
- Selects information carefully
- Documents decisions
- Builds beyond tutorials
- Connects data to practical use
- Continues learning
- Can communicate with both technical and business audiences

The site should not tell visitors that Jonathan is thoughtful, reliable and technically capable.

It should make those conclusions unavoidable through the quality of the work, structure and presentation.
